

NEW CRITICAL VULNERABILITY ADVISORY: CVE-2026-86148

Summary

CVE-2026-86148 is a newly disclosed Critical vulnerability. It is not yet on CISA's actively-exploited list; treat it as proactive patching before it is weaponised. A security flaw has been discovered in Tenda CP3 27.5.57.101. This vulnerability affects the function SystemAsh of the file Apis/system.c of the component Kylin. The manipulation of the argument AlarmVoiceURL results in os command injection. It is possible to launch the attack remotely.

What we know

- **CVE:** CVE-2026-86148
- **Status:** Newly disclosed, not yet known-exploited (not on CISA KEV)
- **Severity:** CVSS 9.1 Critical, Network-exploitable, no user interaction (CVSS:3.1/AV:N/AC:L/PR:H/UI:N/S:C/C:H/I:H/A:H)
- **Exploitation likelihood (EPSS):** 2%

Recommended action

Patch as a fix becomes available, prioritised by the exposure and EPSS above. Until then, limit network exposure of the affected service and tighten access until patched. This does not yet trigger CRA 24-hour reporting, which requires active exploitation, but patching ahead of exploitation is the whole point.
